Source Declaration

Team Pragyan | MedBhasha Round 1

> **Compliance Statement:** Our corpus of 762 clinical notes was compiled exclusively from approved open sources and synthetic generation, which strictly complies with Section 1 and Section 2 of the Data Collection Rules.

Data Sources

- **Public Health Portals (Open Source):**
  - **Vikaspedia Health:** 54 clinical sentences extracted from open-access verified disease guidelines.
  - **Shohay Health:** 10 clinical sentences extracted from public pediatric and general health advisories.
- **Synthetic Clinical Notes (LLM Generated):**
  - 40 notes were synthetically generated using an LLM prompted to mimic diverse Bengali clinical documentation styles.
- **Patient Complaint Texts (De-identified/Synthetic):**
  - 658 short clinical complaint statements (e.g., "আমার অনেক মাথা ব্যথা করে") adapted from open-source text classification scenarios.

Annotation Method

The raw text was cleaned and tokenized using regex to isolate Bengali words and punctuation, and formatted into the required BIO scheme using a Python script. The team then manually verified and corrected the BIO tags (B-DIAGNOSIS, I-SYMPTOM, etc.) across all 9,172 tokens to ensure strict follow-up to the schema.
